

TABLE 12-2. Chronology of events, showing the detection of domoic acid (DA) in various marine animals used for human consumption and the physical oceanographic regime in which the event occurred (WBS = Western Boundary System; EBS = Eastern Boundary System).

| Location | Year | Affected Species | | <i>Pseudo-nitzschia</i> Species Implicated | Oceanographic Regime |
|---|--------------|--|---|--|----------------------------|
| | | Common Name | Scientific Name | | |
| Prince Edward Island, Canada | 1987 | Blue mussel | <i>Mytilus edulis</i> | <i>P. multiseriis</i> | WBS, Shallow bay |
| Bay of Fundy, Canada | 1988 | Soft-shell clam Blue mussel Horse mussel Sea scallop | <i>Mya arenaria</i> <i>Mytilus edulis</i> <i>Volvella modiolus</i> <i>Placopecten magellanicus</i> | <i>P. pseudodelicatissima</i> or <i>P. calliantha</i> | WBS, Estuary |
| Washington and Oregon coasts, United States | 1991 | Razor clam Dungeness crab | <i>Siliqua patula</i> <i>Cancer magister</i> | <i>P. australis</i> | EBS, Upwelling |
| Monterey Bay, California, United States | 1991 | Northern anchovy | <i>Engraulis mordax</i> | Not directly linked | EBS, Upwelling, Bay |
| Pacific coast of the United States | 1991 to 1993 | Blue crab Rock crab Stone crab Spiny lobster | <i>Cancer spidus</i> <i>Cancer pagurus</i> <i>Menippe adina</i> <i>Palinurus elephas</i> | Not directly linked | EBS, Upwelling |
| Coastal New Zealand | 1993 to 1997 | Maori scallop Greenshell mussel Pacific oyster New Zealand cockle Chilean oyster Tuata surf clam | <i>Pecten novaezealandiae</i> <i>Perna canaliculus</i> <i>Crassostrea gigas</i> <i>Austrovenus stutchburyi</i> <i>Tiostrea chilensis</i> <i>Paphies subtriangulata</i> | <i>P. australis</i> , <i>P.</i> <i>pungens</i> | WBS, Upwelling |
| Galicia, NW Spain | 1994 | Mediterranean mussel | <i>Mytilus galloprovincialis</i> | <i>P. australis</i> | EBS, Upwelling |
| Georges, German and Browns Banks, Gulf of Maine | 1995 | Sea scallop | <i>Placopecten</i> <i>magellanicus</i> | <i>P. seriata</i> (likely) | WBS, Banks |
| Baja California peninsula, Mexico | 1995 | Pacific mackerel | <i>Scomber japonicus</i> | <i>Pseudo-nitzschia</i> spp. | EBS, Upwelling |
| Offshore Portugal | 1996 | Blue mussel Common cockle Peppery furrow shell clam Pullet carpet shell European oyster Razor clam Clam | <i>Mytilus edulis</i> <i>Cerastoderma edule</i> <i>Scrobicularia plana</i> <i>Venerupis pullastra</i> <i>Ostrea edulis</i> <i>Ensis</i> spp. <i>Ruditapes decussata</i> | <i>P. australis</i> (likely) | EBS, Upwelling |
| Chinhae Bay, South Korea | 1998 | Various shellfish | Not specified | <i>P. multiseriis</i> | WBS, Shallow bay |
| Washington and Oregon coasts, United States | 1991 to 2005 | Razor clam | <i>Siliqua patula</i> | <i>P. pseudodelicatissima</i> , <i>P. australis</i> | EBS, Upwelling |
| Central coast, California, United States | 1998 | Northern anchovy | <i>Engraulis mordax</i> | <i>P. australis</i> | EBS, Upwelling |
| Offshore Scotland | 1999 to 2000 | King scallop | <i>Pecten maximus</i> | <i>P. australis</i> , <i>P. seriata</i> | EBS, Tidal, Downwelling |
| Offshore Ireland | 1999 | King scallop | <i>Pecten maximus</i> | <i>P. australis</i> | EBS, Tidal, Downwelling |
| Western Brittany, France | 1999 | Wedge shell clam | <i>Donax trunculus</i> | <i>P. multiseriis</i> | EBS, Upwelling |
| Monterey Bay, California, United States | 2000 | Pacific mackerel Albacore tuna Northern anchovy Pacific sardine Market squid | <i>Scomber japonicus</i> <i>Thunnus alalunga</i> <i>Engraulis mordax</i> <i>Sardinops sagax</i> <i>Loligo opalescens</i> | <i>P. australis</i> | EBS, Upwelling |

(continued)

TABLE 12-2. (continued)

| Location | Year | Affected Species | | <i>Pseudo-nitzschia</i> Species Implicated | Oceanographic Regime |
|---|--------------|---------------------|--------------------------------------|---|-------------------------|
| | | Common Name | Scientific Name | | |
| Offshore Portugal | 2000 to 2001 | European sardine | <i>Sardina pilchardus</i> | Not determined | EBS, Upwelling |
| | | European anchovy | <i>Engraulis encrasicolus</i> | | |
| | | Blue mussel | <i>Mytilus edulis</i> | | |
| | | Pacific sardine | <i>Sardinops sagax</i> | | |
| | | Common cockle | <i>Cerastoderma edule</i> | | |
| | | Pullet carpet shell | <i>Venerupis pullastra</i> | | |
| | | Clam | <i>Ruditapes decussate</i> | | |
| | | Oyster | <i>Crassostrea japonica</i> | | |
| | | Razor clam | <i>Ensis</i> spp., <i>Solen</i> spp. | | |
| Southern Gulf of St. Lawrence, Canada | 2002 | Blue mussel | <i>Mytilus edulis</i> | <i>P. seriata</i> | WBS, Deep estuary |
| Offshore Portugal | 2002 | Swimming crab | <i>Polybius henslowii</i> | Not directly linked | EBS, Upwelling |
| Offshore Portugal | 2003 | Common octopus | <i>Octopus vulgaris</i> | Not directly linked | EBS, Upwelling |
| | | Common cuttlefish | <i>Sepia officinalis</i> | | |
| Puget Sound, Washington, United States | 2003 | Blue mussel | <i>Mytilus edulis</i> | <i>P. australis</i> | Deep estuary |
| Southern California, United States | 2003 to 2004 | Red crab | <i>Pleuroncodes planipes</i> | <i>P. australis</i> and <i>P. multiseriata</i> | EBS, Upwelling |
| | | Pacific mackerel | <i>Scomber japonicus</i> | | |
| | | Jack mackerel | <i>Trachurus symmetricus</i> | | |
| | | Pacific sanddab | <i>Citharichthys sordidus</i> | | |
| | | Longspine combfish | <i>Zaniolepis latipinnis</i> | | |
| Monterey Bay, California, United States | 2003 to 2004 | Rex sole | <i>Errex zachirus</i> | <i>P. australis</i> (likely) | EBS, Upwelling |
| | | Dover sole | <i>Microstomus pacificus</i> | | |
| | | English sole | <i>Pleuronectes vetulus</i> | | |
| | | Curlfin turbot | <i>Pleuronectes decurrens</i> | | |
| Santa Cruz wharf, California, United States | 2004 | White croaker | <i>Genyonemus lineatus</i> | <i>P. australis</i> (likely) | EBS, Upwelling |
| | | Staghorn sculpin | <i>Gymnocanthus tricuspidis</i> | | |

The *Pseudo-nitzschia* species implicated may have been fed on either directly or indirectly by the animals. The table does not include marine zooplankton, birds, and mammals that have also been affected by DA. References are found in Bates *et al.* (1998) and Bates and Trainer (2006).

increase since the original 1987 ASP outbreak in eastern Canada. This is probably because toxigenic *Pseudo-nitzschia* species are ubiquitous, and more events are being detected as more countries establish regulatory programs to monitor for the presence of DA in food products from the sea.

OCEANOGRAPHY AND TOXIC DIATOM BLOOMS

Toxic blooms may arise under several different oceanographic settings, and the challenge is to tease out which controlling factors are most important. In spite of intense research on the biological and chemical influences on the bloom formation of HABs, the details of bloom initiation and termination and the species composition of a bloom remain elusive. Why does one species of diatom (e.g., toxic

Pseudo-nitzschia multiseriata) begin to grow and become dominant at a particular location and time? The given species must, of course, be present, but then certain biological factors (such as grazing by zooplankton and filter-feeding molluscs, infection by fungi and viruses, and inherent physiological properties) must also exert an important influence. In the case of *Pseudo-nitzschia* species, there is evidence that they are more lightly silicified than other coastal diatoms (Marchetti *et al.*, 2004) and may therefore have a competitive growth advantage at low silicon concentrations. Some work has indicated that toxigenic *Pseudo-nitzschia* species may also have unique capabilities to acquire trace metals such as iron and copper (e.g., Wells *et al.*, 2005), thereby giving them a competitive growth advantage over other phytoplankton.

Ocean circulation and seawater properties exert an additional important influence in the development of toxic diatom blooms; the details are largely unknown, but this is
